

DRY-RUN GUIDE | temp.py
Source: Python\1st_Belt\temp.py

CORE BEHAVIOR

Converts between Celsius and Fahrenheit. temp.py branches on a normalized unit letter; temp2.py presents a menu and calls a conversion helper.

REPRESENTATIVE INPUT

For temp.py: '25', 'C'. For temp2.py: choice '1', then '25'.

STEP TRACE

Select Celsius-to-Fahrenheit; compute $25 \times 9/5 + 32 = 77.0$; format to two decimal places.

EXPECTED OUTPUT / RETURN

'25.0?C is equal to 77.00?F' (menu prompts may also appear).

ACTUAL SOURCE EXCERPT

Verbatim excerpt from Python\1st_Belt\temp.py; line numbers refer to the original file. No source was modified.

```
001 | # Question: Calculate a person's age from the present year and birth year.
002 | # Add your solution here.
003 |
004 | def celsius_to_fahrenheit(celsius):
005 |     return (celsius * 9/5) + 32
006 |
007 | def fahrenheit_to_celsius(fahrenheit):
008 |     return (fahrenheit - 32) * 5/9
009 |
010 | print("1. Convert Celsius to Fahrenheit")
011 | print("2. Convert Fahrenheit to Celsius")
012 |
013 | choice = input("Choose 1 or 2: ")
014 |
015 | if choice == '1':
016 |     c = float(input("Enter temperature in Celsius: "))
017 |     f = celsius_to_fahrenheit(c)
018 |     print(f"{c}?C is equal to {f:.2f}?F")
019 | elif choice == '2':
020 |     f = float(input("Enter temperature in Fahrenheit: "))
021 |     c = fahrenheit_to_celsius(f)
022 |     print(f"{f}?F is equal to {c:.2f}?C")
023 | else:
024 |     print("Invalid choice.")
```

DRY-RUN NOTE

Values are representative. For function-only modules the guide uses an illustrative direct call and explains its return; quirks/errors describe actual behavior.
