

DRY-RUN GUIDE | temp2.py

Source: Python\1st_Belt\temp2.py

CORE BEHAVIOR

Converts between Celsius and Fahrenheit. temp.py branches on a normalized unit letter; temp2.py presents a menu and calls a conversion helper.

REPRESENTATIVE INPUT

For temp.py: '25', 'C'. For temp2.py: choice '1', then '25'.

STEP TRACE

Select Celsius-to-Fahrenheit; compute $25 \times 9/5 + 32 = 77.0$; format to two decimal places.

EXPECTED OUTPUT / RETURN

'25.0?C is equal to 77.00?F' (menu prompts may also appear).

ACTUAL SOURCE EXCERPT

Verbatim excerpt from Python\1st_Belt\temp2.py; line numbers refer to the original file. No source was modified.

```
001 | # Question: Solve the temperature-related challenge implemented in this program.
002 | # Add your solution here.
003 |
004 | temp = float(input("Enter the temperature value: "))
005 |
006 | unit = input("Enter the unit (C for Celsius, F for Fahrenheit): ").strip().upper()
007 |
008 | if unit == "C":
009 |     fahrenheit = (temp * 9/5) + 32
010 |     print(f"{temp}?C is equal to {fahrenheit:.2f}?F")
011 | elif unit == "F":
012 |     celsius = (temp - 32) * 5/9
013 |     print(f"{temp}?F is equal to {celsius:.2f}?C")
014 | else:
015 |     print("Invalid unit entered. Please enter 'C' or 'F'.")
```

DRY-RUN NOTE

Values are representative. For function-only modules the guide uses an illustrative direct call and explains its return; quirks/errors describe actual behavior.
