

DRY-RUN GUIDE | aurthomourphs.py

Source: Python\2nd_Belt\aurthomourphs.py

CORE BEHAVIOR

Squares the integer and tests whether its square ends in the original digits. The comment says anagram, but executable code checks automorphic numbers.

REPRESENTATIVE INPUT

'25'

STEP TRACE

25**2=625; string '625' ends with '25', so the predicate is true.

EXPECTED OUTPUT / RETURN

'true'

ACTUAL SOURCE EXCERPT

Verbatim excerpt from Python\2nd_Belt\aurthomourphs.py; line numbers refer to the original file. No source was modified.

```
001 | # Question: Check whether the given strings are anagrams.
002 | # Add your solution here.
003 |
004 | def is_automorphic(n):
005 |     square = n ** 2
006 |
007 |     return str(square).endswith(str(n))
008 |
009 | n = int(input())
010 |
011 | if is_automorphic(n):
012 |     print("true")
013 | else:
014 |     print("false")
015 |
```

DRY-RUN NOTE

Values are representative. For function-only modules the guide uses an illustrative direct call and explains its return; quirks/errors describe actual behavior.
