

DRY-RUN GUIDE | atm_pin_validator.py
Source: Python\2nd_Belt\atm_pin_validator.py

CORE BEHAVIOR

Allows up to three PIN attempts. The correct value is the literal string 4321; success breaks the loop, while three failures deny access.

REPRESENTATIVE INPUT

Enter '1111', then '4321'.

STEP TRACE

Attempt 1 mismatches and prints Incorrect PIN. Attempt 2 matches; set access_granted=True, report two attempts, and break.

EXPECTED OUTPUT / RETURN

'Incorrect PIN.' then 'Access Granted! You used 2 attempt(s).'

ACTUAL SOURCE EXCERPT

Verbatim excerpt; line numbers refer to the original source, which was not modified.

```
001 | # Question: Check whether the entered ATM PIN is valid.
002 | # Add your solution here.
003 |
004 | correct_pin = "4321"
005 | attempts = 0
006 | max_attempts = 3
007 | access_granted = False
008 |
009 | print("Welcome to the ATM PIN Validator!")
010 |
011 | while attempts < max_attempts:
012 |     pin_entered = input(f"Enter your PIN (Attempt {attempts + 1}/{max_attempts}): ")
013 |     attempts += 1
014 |
015 |     if pin_entered == correct_pin:
016 |         access_granted = True
017 |         print(f"Access Granted! You used {attempts} attempt(s).")
018 |         break
019 |     else:
020 |         print("Incorrect PIN.")
021 |
022 | if not access_granted:
023 |     print(f"Access Denied. You have used all {max_attempts} attempts.")
024 |
```

DRY-RUN NOTE

Trace describes actual source behavior, including errors where applicable.
