

Python Practice Solutions

Topics: Syntax, Output, Comments, Variables

Solution 1:

```
python

print("Name: Riya")
print("Age: 21")
print("City: Udaipur")
```

Solution 2:

```
python

# This variable stores the price of an item in rupees
price = 500
print("The price is:", price)
```

Solution 3:

```
python

print("Python", "is", "fun")
```

Solution 4:

```
python

a = 10
b = 20
c = 30
print("Sum:", a + b + c)
```

Solution 5:

```
python
```

```
"""
```

```
This program calculates the area  
of a rectangle using length and breadth.
```

```
"""
```

```
length = 5  
breadth = 3  
area = length * breadth  
print("Area of rectangle:", area)
```

Solution 6:

```
python
```

```
x = 5  
y = 10  
  
print("Before swap: x =", x, ", y =", y)  
  
x, y = y, x  
  
print("After swap: x =", x, ", y =", y)
```

Solution 7:

```
python
```

```
p = q = r = 100  
print("Same value:", p, q, r)  
  
p, q, r = 1, 2, 3  
print("Different values:", p, q, r)
```

Solution 8:

```
python
```

```
name = "Aarav"
marks = 87

# Method 1: comma-separated
print(name, "scored", marks, "marks.")

# Method 2: string concatenation
print(name + " scored " + str(marks) + " marks.")

# Method 3: f-string
print(f"{name} scored {marks} marks.")
```

Solution 9:

```
python

print("Hello World")    # 'print' must be lowercase
age = 20
if age > 18:             # missing colon
    print("Adult")       # missing closing quote
```

Solution 10:

```
python

# Valid names: name1, _name, my_name
# Invalid: 1name (starts with digit), my-name (hyphen not allowed),
#          class (reserved keyword), total$ (special character not allowed)

name1 = 1
_name = 1
my_name = 1

print(name1, _name, my_name)
```
