

Python Practice Questions

Topics: Syntax, Output, Comments, Variables

Q1 (Easy) — Print Your Details Write a Python program to print your name, age, and city on three separate lines using `print()`.

Q2 (Easy) — Comments Practice Write a program that has a variable `price = 500`, and add a comment above it explaining what the variable stores. Then print the price with a message.

Q3 (Easy) — Single Line, Multiple Outputs Print the words "Python", "is", "fun" on the same line using a single `print()` statement, separated by spaces.

Q4 (Easy) — Variable Assignment Create three variables `a`, `b`, and `c` storing the values `10`, `20`, and `30`. Print their sum.

Q5 (Easy) — Multiline Comments Write a short program that calculates the area of a rectangle (length $\times$ breadth). Add a multi-line comment (using triple quotes) at the top explaining what the program does.

Q6 (Medium) — Swapping Variables Write a program to swap the values of two variables `x` and `y` without using a third variable. Print the values before and after swapping.

Q7 (Medium) — Multiple Assignment Write a program that assigns the same value `100` to three variables `p`, `q`, and `r` in a single line, then assigns different values `1`, `2`, `3` to them in another single line. Print both results.

Q8 (Medium) — Formatted Output Given `name = "Aarav"` and `marks = 87`, print the output as: `Aarav scored 87 marks.` using **three different methods**: comma-separated print, string concatenation, and f-string.

Q9 (Medium) — Syntax Error Spotting The following code has syntax errors. Identify and fix them:

```
python

Print("Hello World")
age = 20
if age > 18
    print("Adult")
```

Q10 (Medium) — Variable Naming Rules Which of these variable names are valid in Python? Write a program that only creates the valid ones and assigns each the value `1`, then prints them.

```
lname, name1, _name, my-name, my_name, class, total$
```
